

Your health & genetic traits

All findings below are fictional examples. No real DNA has been assessed.

● Potential risk association

● Potential favorable association

HEALTH ASSESSMENT

Potential risks

● **Type 2 diabetes**

Example: higher susceptibility tendency

● **Iron accumulation**

Example: potential increased tendency

● **Blood pressure**

Example: higher susceptibility tendency

● **Vitamin D levels**

Example: tendency toward lower levels

Potential favorable findings

● **LDL cholesterol**

Example: tendency toward lower levels

● **Bone mineral density**

Example: favorable density tendency

● **Lactose digestion**

Example: likely adult lactose tolerance

● **Blood triglycerides**

Example: tendency toward lower levels

These examples demonstrate the report layout, not proven genetic effects for a person. A favorable association does not guarantee protection, and a risk association does not establish disease.

PHYSICAL TRAITS

Eye color

Blue / gray

Skin pigmentation

Fair / light

Hair color

Dark brown

Illustrative predicted traits; appearance is influenced by many genetic and other factors.

AUTISM & SYNDROME-RELATED FINDINGS

● **Autism-related research associations**

Fictional example: a research association is noted. This does not establish autism or provide a clinically validated estimate of overall autism risk.

● **Syndrome-related / carrier findings**

Fictional example: a possible carrier-related finding is flagged for review. Carrier status differs from having a syndrome; clinical testing is needed to confirm a finding.

Educational information only. Consumer DNA files have limited coverage and may contain errors. Do not change treatment based on this report. Discuss health findings with a qualified clinician or genetic counselor.
